

CLAIMS

1. Door with a door leaf which can be moved between an open position and a closed position; with a guide rail arrangement to guide the movement of the door leaf; with a fastening arrangement for attaching a rail element of the guide rail arrangement to a wall containing the opening to be closed by the door leaf, the fastening arrangement comprising a plurality of fastening elements, each of which can be fixed on one side to the wall and on the other side to the rail element; and with tensioning means, which can be fixed in position at one end to the door leaf and at the other end to a drive device and/or a counterbalancing device, characterized in that the guide rail arrangement is provided with at least one protective element, which can be attached to the rail element and/or to one of the fastening elements and which serves to bridge the gap between the rail element and the wall.

2. Door according to Claim 1, characterized in that the protective element can be removably attached to at least one of the fastening elements and/or to the rail element.

3. Door according to Claim 1 or Claim 2, characterized in that at least one of the fastening elements is designed essentially in the form of an angle piece with two sidepieces forming an angle of preferably about 90° with each other, where the first sidepiece can be attached to the wall, the second sidepiece to the rail element.

4. Door according to Claim 3, characterized in that the second sidepiece has a receiving area to receive a fastening area of the protective element.

5. Door according to Claim 4, characterized in that the receiving area is designed in the form of a pressed-out section in the second sidepiece.

6. Door according to Claim 4 or Claim 5, characterized in that a boundary surface of the fastening area has a profiling, which arrives in contact with a boundary surface of the second sidepiece and prevents the protective element from separating from the fastening element.

7. Door according to one of the preceding claims, characterized in that the protective element has a cover area, where, between a boundary surface of the second sidepiece opposite the rail element and the cover area, an intermediate

space is formed, which is designed to receive the fastening means serving to attach the rail element to the second sidepiece.

8. Door according to one of the preceding claims, characterized in that the protective element consists at least partially of plastic.

9. Door according to one of the preceding claims, characterized in that the door leaf has a plurality of panels, which are hinged to each other with axes extending more-or-less perpendicular to the rail element.

10. Guide rail arrangement for a door according to one of the preceding claims with a rail element, which can be attached to a wall, and a fastening arrangement with a plurality of fastening elements, which can be attached on one side to the wall and on the other side to the rail element, characterized by at least one protective element, which can be attached to the rail element and/or to at least one of the fastening elements and which serves to bridge the gap formed between the rail element and the wall.
